

FlockTrax Mobile 1.0.5 Release Changes

Date: 2026-07-13

Release Baseline

This list describes the user-facing mobile changes accumulated since the last confirmed public iOS release, 1.0.1 (10), which went live on 2026-05-06.

The hosted Android release marker was 1.0.2 (7) dated 2026-05-15, but the project record does not confirm that artifact reached a public Google Play release. Android 1.0.5 (11) should therefore be treated as the first clearly documented full Android production submission in this release record.

Work Orders And Action Items

- Added a dedicated `Work Orders` workspace without cluttering the daily flock-care dashboard.
- Lists open Action Items across the farms and barns available to the signed-in worker.
- Supports `By Barn` and `All Barns` views, search, classification, ownership, status, and sort filters.
- Added an optional `Include Resolved` view with green resolved-item edge markers.
- Added complete dated memo/update history to each ticket.
- Workers can post progress, parts-ordered, ordinary memo, and resolution entries.
- Saving a memo keeps the worker on the same ticket and immediately refreshes its history.
- Ticket modals now move above the mobile keyboard so entered text remains visible.
- Added a placement-level Action Items tab and a `Barn Repairs` shortcut from flock cards.
- Preserved the Action Item audit trail by adding new dated entries rather than editing saved memos.

Read-Only Operations Calendar

- Added a third dashboard workspace for upcoming Placements and Livehaul schedules.
- Added month navigation and separate placement/livehaul filtering.
- Placement badges show the scheduled chick count and support separate male/female arrival dates.
- Livehaul badges show the scheduled bird count to be taken.
- Tapping a badge opens limited operational detail only.
- The calendar contains no create, edit, delete, reschedule, or administrative controls.
- Upcoming placements in both `scheduled` and `awaiting_arrival` lifecycle states are included.

Weather And Daily Conditions

- Added farm selection to the dashboard weather popup using farms visible to the worker.
- Expanded weather into compact `Now`, `Forecast`, and `Farm Details` views.
- Added feels-like temperature, relative humidity, wind, gusts, precipitation, cloud cover, pressure, visibility, dew point, sunrise/sunset, and UV information where available.
- Added a seven-day forecast while keeping the immediate conditions display compact.
- Added current relative humidity to daily-log weather collection and persistence.
- Existing historical weather values are preserved rather than overwritten with current conditions.

Daily Flock Work

- Improved historical daily-log date navigation and date-picker behavior.
- Corrected historical entry handling so work can be recorded against the intended log date.
- Improved mortality, grading, and permission handling so unrelated null grading values do not block an authorized mortality save or incorrectly appear as an expired session.
- Added clearer first-seven-day mortality summaries and recent-mortality access.
- Improved feed-drop controls and recovery behavior, including off-farm redirected drops.
- Corrected dashboard lifecycle selection so the true current or awaiting-arrival flock is shown.

Account And Release Reliability

- Retained the in-app account deletion flow required by Apple.
- Improved session persistence, authentication recovery, and user-facing authorization errors.
- Added published mobile version/build/date display from hosted release control metadata.
- Updated the Expo/React Native release baseline and production bundle configuration.

Release Identifiers

- Marketing version: 1.0.5
- iOS build: 17
- Android version code: 11
- Release date: 2026-07-13
